Introduction

The EORTC quality of life questionnaire (QLQ) is an integrated system for assessing the health-related quality of life (QoL) of cancer patients participating in international clinical trials. The core questionnaire, the QLQ-C30, is the product of more than a decade of collaborative research. Following its general release in 1993, the QLQ-C30 has been used in a wide range of cancer clinical trials, by a large number of research groups; it has additionally been used in various other, non-trial studies.

This manual contains scoring procedures for the QLQ-C30 versions 1.0, (+3), 2.0 and 3.0; it also contains summary information about supplementary modules.

All publications relating to the QLQ should use the scoring procedures described in this manual.

This manual will be updated at regular intervals, to reflect future changes to the QLQ and to incorporate new supplementary modules.
Background

The EORTC

The European Organisation for Research and Treatment of Cancer (EORTC) was founded in 1962, as an international non-profit organisation. The aims of the EORTC are to conduct, develop, coordinate and stimulate cancer research in Europe by multidisciplinary groups of oncologists and basic scientists. Research is accomplished mainly through the execution of large, prospective, randomised, multicentre, cancer clinical trials.

The EORTC Central Office Data Center, created in 1974, is concerned with all aspects of phase II and phase III cancer clinical trials, from their design to the publication of the final results. Since its inception, over 80,000 patients have been entered in trials handled by the EORTC Data Center.

In 1980, the EORTC created the Quality of Life Group, which in 1986 initiated a research programme to develop an integrated, modular approach for evaluating the QoL of patients participating in cancer clinical trials. This led to the development of the EORTC QLQ-C30, a quality of life instrument for cancer patients. To date, more than 2200 studies using the QLQ-C30 have been registered.

EORTC QLQ-C36

A first generation core questionnaire, the EORTC QLQ-C36, was developed in 1987. This 36-item questionnaire was designed to be (1) cancer specific, (2) multidimensional in structure, (3) appropriate for self-administration (i.e. brief and easy to complete), and (4) applicable across a range of cultural settings. Detailed results of the international field-testing of the EORTC QLQ-C36 have been reported (Aaronson et al., 1991). While the overall psychometric results were promising, they also pointed to some areas in which the questionnaire could benefit from further development. Most of the revision involved only minor changes in the wording of items. A few items were found to be non-informative, and were discarded. The only scale requiring substantial revision, because of inadequate reliability, was the eight-item emotional functioning scale. In the next generation of the instrument, this scale was substituted by a four-item emotional functioning scale that had been used previously in EORTC clinical trials.

EORTC QLQ-C30 version 1.0

A second generation core questionnaire, the first version of the 30-item EORTC QLQ-C30 (Appendix 1a), was subsequently developed. The content areas covered by the questionnaire reflect the multi-dimensionality of the QoL construct. This questionnaire was field tested in a cross-cultural sample of lung cancer patients in 13 countries to confirm the hypothesised scale structure, to establish reliability and to evaluate validity (Aaronson et al., 1993).

The QLQ-C30 version 1.0 (QLQ-C30(V1)) incorporates five functional scales (physical, role, cognitive, emotional, and social), three symptom scales (fatigue, pain, and nausea and vomiting), a global health status / QoL scale, and a number of single items assessing additional symptoms commonly reported by cancer patients (dyspnoea, loss of appetite, insomnia, constipation and diarrhoea) and perceived financial impact of the disease.
EORTC QLQ-C30 (+3)
The third generation core questionnaire, the 33-item EORTC QLQ-C30(+3) (Appendix 1b), arose following international testing of the QLQ-C30(V1), when refinement of the questionnaire by adding three new test items was recommended. Two of these test items (QLQ-C30(+3)/Q_{26}, and QLQ-C30(+3)/Q_{27}) were introduced as possible alternatives to the two-item role functioning scale (QLQ-C30(V1)/Q_6, QLQ-C30(V1)/Q_7), which was found to have sub-optimal internal consistency in previous studies. The third new test item, overall health (QLQ-C30(+3)/Q_{32}), was evaluated as a possible replacement for the overall physical condition item (QLQ-C30(V1)/Q_{29}) in the global health status / QoL scale, and employed the same 7-point response scale as the other two questions in that scale.

EORTC QLQ-C30 version 2.0
The QLQ-C30(+3) was an interim version, which retained all the original questions of the QLQ-C30 version 1.0 while evaluating the additional three items. There was a marked improvement in the internal consistency of the new role functioning scale. The new overall health item places less emphasis upon physical functioning, and did not alter the internal consistency. Having formally validated these new items, the older questions were replaced by the new ones (Osoba et al., 1997). The result was the 30-item version 2.0 of the QLQ, the QLQ-C30(V2) (Appendix 1c).

EORTC QLQ-C30 version 3.0
Version 3.0 of the QLQ-C30 differs from version 2.0 in that it has four-point scales for the first five items (QLQ-C30(V3), Appendix 1d). These are coded with the same response categories as items 6 to 28, namely “Not at all”, “A little”, “Quite a bit” and “Very much.” To allow for these categories, question 4 has been re-worded as “Do you have to stay in a bed or a chair during the day?” Version 3.0 has been tested in EORTC field studies (Bjordal et al., 2000).

Latest information about development of the QLQ-C30 and its modules may be found on the EORTC Quality of Life web pages, at:
http://www.eortc.be/home/qol/
Citation and Availability

Citation in published reports
Any publications which describe the use of the EORTC QLQ-C30 or its modules, or which describe analyses of data arising from application of these questionnaires, should explicitly cite the following reference:

For details of the scoring procedure, a suggested format of citation for this manual is:

Scoring procedures
General principles of scoring

The QLQ-C30 is composed of both multi-item scales and single-item measures. These include five functional scales, three symptom scales, a global health status / QoL scale, and six single items. Each of the multi-item scales includes a different set of items - no item occurs in more than one scale.

All of the scales and single-item measures range in score from 0 to 100. A high scale score represents a higher response level. Thus a high score for a functional scale represents a high / healthy level of functioning, a high score for the global health status / QoL represents a high QoL, but a high score for a symptom scale / item represents a high level of symptomatology / problems.

The principle for scoring these scales is the same in all cases:

1. Estimate the average of the items that contribute to the scale; this is the raw score.

2. Use a linear transformation to standardise the raw score, so that scores range from 0 to 100; a higher score represents a higher ("better") level of functioning, or a higher ("worse") level of symptoms.

Coding of the scoring procedure is presented in Appendix 3 for three major statistical packages.

---

**Technical Summary**

In practical terms, if items \( I_1, I_2, \ldots, I_n \) are included in a scale, the procedure is as follows:

**Raw score**
Calculate the raw score
\[
\text{RawScore} = RS = \frac{I_1 + I_2 + \ldots + I_n}{n}
\]

**Linear transformation**
Apply the linear transformation to 0-100 to obtain the score \( S \),

Functional scales:
\[
S = \left(1 - \frac{RS - 1}{\text{range}}\right) \times 100
\]

Symptom scales / items:
\[
S = \left(\frac{RS - 1}{\text{range}}\right) \times 100
\]

Global health status / QoL:
\[
S = \left(\frac{RS - 1}{\text{range}}\right) \times 100
\]

*Range* is the difference between the maximum possible value of \( RS \) and the minimum possible value. The QLQ-C30 has been designed so that all items in any scale take the same range of values. Therefore, the range of \( RS \) equals the range of the item values. Most items are scored 1 to 4, giving \( \text{range} = 3 \). The exceptions are the items contributing to the global health status / QoL, which are 7-point questions with \( \text{range} = 6 \), and the initial yes/no items on the earlier versions of the QLQ-C30 which have \( \text{range} = 1 \).

* Item range is the difference between the possible maximum and the minimum response to individual items; most items take values from 1 to 4, giving range = 3.
† (revised) scales are those that have been changed since version 1.0, and their short names are indicated in this manual by a suffix “2” – for example, PF2.

For all scales, the RawScore, RS, is the mean of the component items:

\[ \text{RawScore} = RS = \left( \frac{I_1 + I_2 + \ldots + I_n}{n} \right) \]

Then for **Functional scales**:

\[ \text{Score} = \left[ 1 - \left( \frac{RS - 1}{\text{range}} \right) \right] \times 100 \]

and for **Symptom scales / items** and **Global health status / QoL**:

\[ \text{Score} = \left[ \frac{(RS - 1)}{\text{range}} \right] \times 100 \]

**Examples:**

- Emotional functioning
  \[ \text{RawScore} = \frac{Q_{21} + Q_{22} + Q_{23} + Q_{24}}{4} \]
  \[ \text{EF Score} = \left[ 1 - \left( \text{RawScore} - 1 \right) / 3 \right] \times 100 \]

- Fatigue
  \[ \text{RawScore} = \frac{Q_{10} + Q_{12} + Q_{18}}{3} \]
  \[ \text{FA Score} = \left[ \left( \text{RawScore} - 1 \right) / 3 \right] \times 100 \]
Scoring earlier versions of the EORTC QLQ-C30

Table 2: Scoring the QLQ-C30 version 2.0
For the QLQ-C30 (V2), the only difference is that $Q_1$ to $Q_5$ are coded yes/no, with range = 1.
The following should be added to Table 1, and the revised scale for PF2 deleted.

</tbody>
</table>

* Item range is the difference between the possible maximum and the minimum response to individual items; most items take values from 1 to 4, giving range = 3.
**Missing data**

Missing data may be classified as either missing items (one or more missing answers to questions within a questionnaire), or missing forms (the whole questionnaire is missing for a patient). Fayers and Machin (2000) describe methods of analysis for use when data are missing, including imputation techniques.

**Missing items**

Sometimes a patient will fail to answer a few questions on the QLQ-C30. Our experience to date suggests that less than 2% of patient data will be missing for the QLQ core questionnaire. However, supplementary modules addressing, for example, sexuality issues may have more serious problems with patient compliance. In theory it is important to distinguish between items, which are accidentally missing (commonly described as "missing completely at random"), and items, which are missing for a particular reason. For example, if patients feel very poorly with respect to one item they might wish to avoid answering that question. In practice, however, there is likely to be no way of deciding whether there was a specific reason for the missing values and, in general, it would seem likely that most missing items occur completely at random. In such cases the investigator may wish to calculate the scores based upon those items that were completed, possibly by "imputing" or estimating the missing item.

Various statistical methods exist for imputing values. One might, for example, use multivariate techniques that attempt to estimate the most likely value given information about (a) that patient's previous responses to the same item, (b) other patients’ responses at a similar stage in their disease progression and therapy, or (c) the inter-relations and covariance structure with other items.

A simple method for imputing items from multi-item scales, which has been used by many QoL instruments, is the following: if at least half of the items from the scale have been answered, assume that the missing items have values equal to the average of those items which are present for that respondent. However, this rule is not always appropriate, and caution should be exercised. Application of this method of imputation is simpler than it perhaps seems; it can be shown that this is algebraically equivalent to using all items, which were completed, and applying the equations already given under “Scoring procedures” for calculating the scale scores; the missing items are simply ignored when making the calculations. Hence the above equations for multi-item scales can be used whenever at least half the items are completed.

<table>
<thead>
<tr>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Emotional functioning if Q23 is missing</strong></td>
</tr>
<tr>
<td><strong>Raw Score</strong> = ( \frac{(Q_{21} + Q_{22} + Q_{24})}{3} )</td>
</tr>
<tr>
<td><strong>EF Score</strong> = ( [1 - (\text{Raw Score} - 1)/3] \times 100 )</td>
</tr>
</tbody>
</table>

For example, role functioning (RF) and cognitive functioning (CF) each contain 2 items, and so these scales can be estimated whenever one of their constituent items is present; physical functioning contains 5 items, and so at least 3 need to have been completed. Using this method, none of the single-item measures can be imputed.
Missing forms
As experience with QoL research has increased among the cancer treatment community, so has the need for innovative strategies to prevent, identify and deal with the problem of missing data. In addition to the potential for incomplete data that can occur when introducing researchers to a relatively new type of patient outcome, QoL assessments are likely to be missed because of negative events that are experienced by patients, such as treatment toxicities, and patients dropping out due to disease progression or even death. Successful integration of QoL endpoints into clinical trials, therefore, involves a comprehensive approach encompassing issues of research design, study implementation, and statistical analysis methods.

When initiating a clinical trial it is essential that an adequate infrastructure be in place to ensure that the study is managed properly and efficiently. The EORTC Quality of Life Group has developed a manual “Guidelines for Assessing Quality of Life in EORTC Clinical Trials” which details the issues which need to be addressed in the design of a clinical trial to ensure that QoL is adequately addressed in the study (Young et al., 1999). Education and training of clinical staff regarding the importance of QoL endpoints, combined with centralised quality assurance strategies, are crucial to the successful integration of these endpoints into clinical trials. Even with such efforts, however, there will be incomplete observations. Although the problem of missing forms is not unique to QoL research, it presents an unusual challenge in that the information is provided by patient self-report at a particular point in time, and thus cannot be retrieved at a later date from medical charts, as is often possible with other types of clinical data.

It is useful to document and report the extent of and reasons for missing data. By identifying the reasons for missing questionnaires it may be possible to learn more about the problems of collecting QoL questionnaires, e.g. institution-related factors, and circumvent these problems in future research. The reasons why questionnaires have not been completed may also provide useful information to take into account at the time of analysis. For example, if the main reasons for observing missing questionnaires is administrative failure, then provided the extent of missingness is not too large, the missing forms may not pose too much of a problem. However, if the main reason for missingness is due to patients feeling too ill to fill out the questionnaire, care has to be taken, as there may be a bias in terms of reporting of results. Fayers and Machin (2000) discuss the issue of bias and suggest ways in which it may be possible to reduce the bias by taking covariates into account. Logistic regression models can also be used to evaluate the association between compliance and selected factors.

Summary – Missing items
- Have at least half of the items from the scale been answered?
- If Yes, use all the items that were completed, and apply the standard equations given on the previous pages for calculating the scale scores; ignore any items with missing values when making the calculations.
- If No, set scale score to missing.
- For single-item measures, set score to missing.
Troxel et al. (1998) described some statistical techniques for assessing and analysing QoL data in the presence of incomplete observations.

Various approaches have been suggested for imputing values, such as mean imputation, regression imputation and last observation carried forward. A major advantage of imputation is that, once the values have been filled in, standard complete data methods of analysis can be used. Some problems do exist using single imputation, e.g. an imputed value is treated as if it were an observed value. This can cause problems, as summary statistics such as percentiles, variances and confidence intervals may have incorrect estimates and hence any inferences that are drawn may be misleading.

**Summary – Missing forms**

Sufficient care and attention should be taken at the design stage of a study to ensure that an adequate infrastructure, including appropriate personnel and material, is available to carry out the study. No matter how well the analysis is thought out and how accurate the assumptions are about the missing data process, inferences based on incomplete data are not as convincing as inferences based on a complete dataset.
Theory of scaling

The scaling technique described above is based upon the widely applied Likert method of summated scales, in which the constituent items within each scale are simply summed. This makes several assumptions about the nature of the items, the most important of which are (a) that it is appropriate to give equal weight to each item, and (b) that each item is graded on a linear or equal-interval scale. Both these assumptions are questionable, and it might be thought that more sophisticated scaling and scoring procedures would be preferable. Fortunately, however, it has been shown that simple linear scoring systems are surprisingly robust (Dawes, 1979). This has led Cox et al. (1992) to propose that “simple integer scoring is likely to be enough for many purposes.”

Linearity of items
Methods for assessing the adequacy of linear scores have been reviewed by Cox and Wermuth (1994). At present we have no grounds to believe that the EORTC QLQ items are sufficiently non-linear to warrant any correction before using them in summated scales.

Weighting of items
The use of weights is a far more complex question. Alternative methods for assigning weights include:

• Analysis techniques such as factor analysis or other data-orientated weights (e.g. Gorsuch, 1983; Olschewski and Schumacher, 1990). However, many authors have noted the inherent instability of factor scores, and recommend that the use of factor analysis should be confined to exploring factor structures and testing hypotheses.

• Techniques which attempt to elicit patients' personal utilities or preferences. Drummond et al. (1997) describe some of the principal methods that are based upon either the “standard gamble” or the “time trade-off” method. Cox et al. (1992) offer a critique of the use of utility methods, and in particular time trade-off, in the context of clinical trials.

• Assignment of arbitrary weights according to opinions of the patients, the investigators, or similar groups (e.g. Simes, 1986).

Cox et al. (1992), Olschewski and Schumacher (1990) discuss alternative scaling systems and the problems of choosing, applying and evaluating scaling methods. The inherent difficulties, together with the relative robustness of simple methods, have led many QoL instruments to employ the Likert summated score method.

The EORTC Quality of Life Group is currently exploring alternative scoring procedures, including the use of Rasch models and item response theory (IRT). Structural equation modelling is also being used to investigate higher order factors. At the present time we recommend using scales based upon unweighted summed scores. Also, it should be noted that we caution strongly against the use of a total, global score based upon the sum of all items. The Global health status / QoL scale (based upon Q29 and Q30 in the QLQ-C30[v3]) should be used as the overall summary measure.

Summary

We currently advocate (unweighted) summated scales. However, work is in progress to explore alternative techniques for evaluating QLQ-C30 scores.
Interpretation of scores

As described in this manual, the raw QLQ-C30 scores can be transformed to scores ranging from 0 to 100. The use of these transformed scores has several advantages, but transformed scores may be difficult to interpret. For example, what does an emotional function score of 60 or a difference of 15 mean? Also, there are no grounds for regarding, say, an emotional function score of 60 as being equally good or bad as scores of 60 on the other functioning scales. However, there are a number of ways to ease the interpretation of QLQ-C30 results.

• One can report the raw scores in addition to the transformed scores. For example, it may be clinically relevant to know the proportion of patients that are ‘Quite a bit’ or ‘Very much’ constipated. This also applies to results from multi-item scales when the responses to the individual items are of interest. In some cases it may be useful to dichotomise scores, for example by grouping scores into ‘Not at all’ vs. ‘Any extent’.

• The scores can be compared against published data, e.g. by using the data for comparable groups of patients published in the EORTC QLQ-C30 Reference Values manual (Fayers et al., 1998). In the Reference Values manual, data are shown for the main cancer sites, divided by stage of disease. General population data based on large random samples from the general population in Norway and Sweden, and females in Denmark are also published (Hjermstad et al., 1998; Klee et al., 1997; Michelson et al., 2000).

Changes in scores over time and differences between groups may be more difficult to interpret than absolute scores. The fact that a change is statistically significant does not necessarily imply that it also has clinical significance. Lydick and Epstein (1993) reviewed the different approaches used to define the ‘Minimal Clinically Important Difference’ and grouped these into anchor-based and distribution-based interpretations.

Anchor-based interpretations compare the changes seen in QoL scores (‘anchored’) against other clinical changes or results. Examples of such approaches used with the QLQ-C30 include:

• Osoba et al. developed the Subjective Significance Questionnaire (SSQ) (Osoba et al., 1998). The SSQ asks patients about perceived changes in physical, emotional, and social functioning and in global QL, using a 7-point scale ranging from ‘much worse’ over ‘no change’ to ‘much better’. Patients filled in the QLQ-C30 at two occasions. At the second completion they also filled in the SSQ. Patients who reported ‘a little’ change for better or worse on a particular scale (function or symptom) had QLQ-C30 changes about 5 to 10. Those reporting ‘moderate’ change had changed about 10 to 20, and ‘very much’ change corresponded to a change greater than 20.

• King (1996) used data from 14 published studies employing the QLQ-C30 or the QLQ-C36, grouping patients according to performance status, weight loss, toxicity, and extent or severity of disease. For each QLQ-C30 scale, the article shows differences in mean scores found between groups differing with respect to the clinical criteria.

Distribution-based interpretations are based on the statistical distributions of results. The most commonly used statistics are Cohen’s effect size (ES), which relates the observed change to the baseline standard deviation (Fayers and Machin, 2000), or the standardised response mean (SRM), which uses the standard deviation of the change. In both Osoba’s and King’s articles, effect sizes were found to increase in concordance with increasing changes in QLQ-C30 scores and SSQ ratings.
Use of statistical packages

Complete examples of coding for SAS, SPSS and STATA are included in Appendix 3.

Here, however, annotated examples describe the method of coding the transformations and allowance for missing values, using SAS and SPSS.

SAS Commands for scoring the QLQ-C30
SAS statements (SAS for Windows, release 6.08) to calculate the score for the EF scale could be written as follows; XNUM is used to count the number of non-missing items, which should be at least half the total NITEMS items in the scale. Thus this code calculates the average of the non-missing values, and transforms this average to range from 0 to 100 provided that the patient has completed at least half the necessary items.

For emotional functioning (EF) there are 4 items, each with a range of 3:

\[
\begin{align*}
\text{NITEMS} & = 4; \\
\text{XNUM} & = \text{N(OF Q21,Q22,Q23,Q24)}; \\
\text{XMEAN} & = \text{MEAN(OF Q21,Q22,Q23,Q24)}; \\
\text{IF } \text{XNUM GE NITEMS / 2 THEN } \\
\text{EF} & = (1 - (\text{XMEAN}-1)/3 ) \times 100;
\end{align*}
\]

For dyspnoea (DY), a symptom comprising a single item with a range of 3:

\[
\begin{align*}
\text{DY} & = ((Q8-1)/3) \times 100;
\end{align*}
\]

SPSS Commands for scoring the QLQ-C30
SPSS statements (SPSS for Windows, release 7.5) to calculate the score for the EF scale could be written as follows; XNUM is used to count the number of non-missing items, which should be at least half the total NITEMS items in the scale. Thus this code calculates the average of the non-missing values, and transforms this average to range from 0 to 100 provided that the patient has completed at least half the necessary items.

For emotional functioning (EF) there are 4 items, each with a range of 3:

\[
\begin{align*}
\text{COMPUTE NITEMS} & = 4, \\
\text{COMPUTE XMEAN} & = \text{MEAN (Q21,Q22,Q23,Q24)}, \\
\text{COMPUTE XNUM} & = \text{NVALID (Q21,Q22,Q23,Q24)}. \\
\text{IF } (\text{XNUM GE NITEMS} / 2) \\
\text{EF} & = (1 - (\text{XMEAN}-1)/3 ) \times 100.
\end{align*}
\]

For dyspnoea (DY), a symptom comprising a single item with a range of 3:

\[
\begin{align*}
\text{COMPUTE DY} & = ((Q8-1)/3) \times 100.
\end{align*}
\]
QLQ Supplementary modules
QLQ supplementary modules

An essential component of the EORTC QLQ development strategy involves the use of supplementary questionnaire modules which, when employed in conjunction with the QLQ-C30, can provide more detailed information relevant to evaluating the QoL in specific patient populations. A module may be developed to assess: (1) symptoms related to a specific tumour site (e.g. urinary symptoms in prostate cancer); (2) side effects associated with a given treatment (e.g. chemotherapy-induced neuropathy); or (3) additional QoL domains affected by the disease or treatment (e.g. sexuality, body-image, fear of disease recurrence, etc.).

Modules are developed according to formal guidelines, which have been published as an EORTC Quality of Life Group manual: *Guidelines for Developing Questionnaire Modules*, Sprangers et al., 1998a, 1998b. These guidelines outline four phases in the module development process:

(1) Generation of relevant QoL issues
(2) Development of the questionnaire items and scales
(3) Module pre-testing
(4) Large scale, international, field studies.

All modules being developed by the EORTC Quality of Life Group are subjected to the rigorous development procedures specified in the guidelines, culminating in large scale international field-testing. The development process for each of the modules is documented in internal reports to the Group, and modules are approved only after formal review of these reports.

All modules are copyrighted in the same way as the core questionnaire. The modules may not be used without prior written consent of the EORTC Data Center or the module developers.

The following modules are currently available for general use, to supplement the core EORTC QLQ-C30. At the time of writing, these are the only modules that have been or are currently being validated in a large-scale international field study.

- Breast cancer module: QLQ-BR23
- Head & neck cancer module: QLQ-H&N35
- Lung cancer module: QLQ-LC13
- Oesophageal cancer module: QLQ-OES24
- Ovarian cancer module: QLQ-OV28

The contact address for these modules is: QL Coordinator, Quality of Life Unit, EORTC Data Center, Avenue E Mounier 83 - B11, 1200 Brussels, Belgium. Tel: +32 2 774 1611. Fax: +32 2 779 4568, Email: abo@eortc.be.

Latest information about development of the QLQ supplementary modules may be found on the EORTC Quality of Life web pages, at: [http://www.eortc.be/home/qol/](http://www.eortc.be/home/qol/)
Breast cancer module: QLQ-BR23

The breast cancer module is meant for use among patients varying in disease stage and treatment modality (i.e. surgery, chemotherapy, radiotherapy and hormonal treatment) (Sprangers et al., 1996). The module comprises 23 questions assessing disease symptoms, side effects of treatment (surgery, chemotherapy, radiotherapy and hormonal treatment), body image, sexual functioning and future perspective (Appendix 2a). The module has been developed according to the guidelines, and approved after formal review. Validation studies in The Netherlands, Spain and the United States have been completed. It has been field tested in a larger cross-cultural study involving 12 countries (EORTC Protocol 15931).

Scoring of the breast cancer module
The breast cancer module incorporates five multi-item scales to assess systemic therapy side effects, arm symptoms, breast symptoms, body image and sexual functioning. In addition, single items assess sexual enjoyment, hair loss and future perspective.

The scoring approach for the QLQ-BR23 is identical in principle to that for the function and symptom scales / single items of the QLQ-C30.†

</table>

* “Item range” is the difference between the possible maximum and the minimum response to individual items.
† Items for the scales marked † are scored positively (i.e. “very much” is best) and therefore use the same algebraic equation as for symptom scales; however, the Body Image scale uses the algebraic equation for functioning scales.

BRSEE, sexual enjoyment, is not applicable if item 15 is “not at all.”
BRHL, upset by hair loss, is not applicable if item 4 is “not at all.”
Head & Neck cancer module: QLQ-H&N35

The head & neck cancer module is meant for use among a wide range of patients with head & neck cancer, varying in disease stage and treatment modality (i.e. surgery, radiotherapy and chemotherapy) (Bjordal and Kaasa, 1992; Bjordal et al., 1994, 1999, 2000). The module comprises 35 questions assessing symptoms and side effects of treatment, social function and body image/sexuality (Appendix 2b). The module has been developed according to the guidelines, and pretested on patients from Norway, Sweden, Denmark, the UK and French-speaking Belgium. It has been field tested in Norway, Sweden and The Netherlands, and in a large cross-cultural study involving more than ten countries (EORTC Protocol 15941).

Scoring of the head & neck cancer module

The head & neck cancer module incorporates seven multi-item scales that assess pain, swallowing, senses (taste and smell), speech, social eating, social contact and sexuality. There are also eleven single items. For all items and scales, high scores indicate more problems (i.e. there are no function scales in which high scores would mean better functioning).

The scoring approach for the QLQ-H&N35 is identical in principle to that for the symptom scales / single items of the QLQ-C30.

* “Item range” is the difference between the possible maximum and the minimum response to individual items.
Lung cancer module: QLQ-LC13

The lung cancer module is meant for use among a wide range of lung cancer patients varying in disease stage and treatment modality (Bergman et al., 1994). The module comprises 13 questions (Appendix 2c). This module was constructed in parallel with the core QLQ-C30, before the guidelines on module development had been established. It was field tested together with the previous versions of the core questionnaire (QLQ-C36, QLQ-C30(V1)). The module is designed for use among patients receiving treatment with chemotherapy and/or radiotherapy. The QLQ-LC13 includes questions assessing lung cancer-associated symptoms (cough, haemoptysis, dyspnoea and site specific pain), treatment-related side effects (sore mouth, dysphagia, peripheral neuropathy and alopecia) and pain medication. The module was field tested together with the previous versions of the core questionnaire.

Scoring of the lung cancer module

The lung cancer module incorporates one multi-item scale to assess dyspnoea, and a series of single items assessing pain, coughing, sore mouth, dysphagia, peripheral neuropathy, alopecia, and haemoptysis.

The scoring approach for the QLQ-LC13 is identical in principle to that for the symptom scales/single items of the QLQ-C30.

</tbody>
</table>

* “Item range” is the difference between the possible maximum and the minimum response to individual items.
† The dyspnoea scale should only be used if all three items have been answered. Some respondents ignore question 5 because they never climb stairs; in this case, the score for the dyspnoea scale would be biased if it were based upon the other two items. Hence if item 5 is missing then items 3 and 4 should be used as single-item measures.
The oesophageal cancer module is designed for patients with local, locally advanced or metastatic disease treated with single or combination treatment including surgery, chemotherapy, radiotherapy or endoscopic palliation. It is also designed for patients receiving treatment with palliative intent (endoscopic stenting, laser, alcohol or diathermy ablation or palliative chemotherapy or radiotherapy). It was developed according to the EORTC Guidelines. It consists of 24 items assessing dysphagia, deglutition, abdominal/GI symptoms, eating difficulties, pain, emotional problems relating to oesophageal cancer and to side effects of chemotherapy/radiotherapy. The provisional module has been translated into Chinese, Danish, Dutch, Finnish, French, German, Italian, Norwegian, Polish, Spanish and Swedish.

Information about the development of the module (in 3 countries) is published (Blazeby et al., 1996, 2000). An international field study (EORTC Protocol 15961/40973) is underway to enable the psychometric properties of the instrument to be fully tested in a cross-cultural context.

**Scoring of the oesophageal cancer module**
The current scoring approach for the oesophageal cancer module is identical in principle to that used for the scales/items of the EORTC QLQ-C30. The scale structure proposed in the table below is based on a hypothesised scale structure. This will be confirmed after completion of the field study (2001).

Ovarian cancer module: QLQ-OV28

The ovarian cancer module is designed for patients with local or advanced disease who receive treatment by surgery with or without chemotherapy. It was developed according to the EORTC Guidelines. It consists of 28 items assessing abdominal/GI symptoms, peripheral neuropathy, other chemotherapy side effects, hormonal symptoms, body image, attitudes to disease/treatment, and sexuality. The provisional module has been translated into Danish, Dutch, French, German, Italian, Portuguese, Spanish and Swedish. Norwegian, Chinese and Russian translations are in preparation.

Preliminary scaling analysis has been conducted on the first 24 items of the module (i.e. excluding items on sexuality) using data from a multicentre chemotherapy trial in the UK (Cull et al., European Journal of Cancer in press). This report also includes information about the development of the module (in 6 countries) and preliminary evidence of its validity. An international field study (EORTC Protocol 15982) is underway to enable the psychometric properties of the full 28-item instrument to be more fully tested in a cross-cultural context.

Scoring of the ovarian cancer module
The scoring approach for the ovarian cancer module is identical in principle to that used for the scales/items of the EORTC QLQ-C30. The scale structure proposed in the table below is based on preliminary scaling analysis of the first 24 items of the module, i.e. excluding items 25-28 on sexuality (Cull et al., European Journal of Cancer in press).

QLQ modules under development - phase III

The following modules are currently at an advanced stage of development (Phase III) by the EORTC Quality of Life Group. Those interested in using them should contact the: QL Coordinator, Quality of Life Unit, EORTC Data Center, Avenue E Mounier 83 - B11, 1200 Brussels, Belgium. Tel: +32 2 774 1611. Fax: +32 2 779 4568, Email: abo@eortc.be.

- **Bladder cancer modules: QLQ-BLsup24, QLQ-BLmi30**
  Two bladder cancer modules have been developed; a 24-item questionnaire for patients with superficial bladder cancer (Ta, T1, CIS), and a 30-item questionnaire for patients with muscle invasive bladder cancer (T2, T3, T4a and T4b). The two modules share a number of common items and scales, including those assessing urinary symptoms, bowel symptoms, and sexual functioning. The superficial bladder cancer module contains additional items assessing side effects of intravesical treatment (fever, malaise, convenience of and worry due to repeated cystoscopies). The muscle-invasive bladder cancer module contains additional items assessing urostomy problems, problems associated with the use of a catheter, and body image. These two modules are currently being translated into the major European languages. The field-testing of these modules will take place in the context of clinical trials of the EORTC Genito-Urinary Tract Cancer Cooperative Group, and other collaborating investigators.

- **Brain cancer module: QLQ-BN20**
  The brain cancer module is intended for patients undergoing chemotherapy or radiotherapy. It includes 20 items assessing future uncertainty, visual disorder, motor dysfunction, communication deficit and other disease symptoms (e.g. headaches and seizures) and treatment toxicities (e.g. hair loss) (Osoba et al., 1996). A validation study has been performed with English-speaking patients from Canada, the UK and the USA.

- **Colorectal cancer module: QLQ-CR38**
  The colorectal cancer module is meant for use among a wide range of patients with colorectal cancer, varying in disease stage and treatment modality. The module comprises 38 questions assessing disease symptoms, side effects of treatment (sphincter-saving resection, rectum extirpation, radiotherapy and chemotherapy), body image, sexuality, and future perspective. All patients complete 19 questions, while the remaining questions are completed by subsamples of patients (males or females; patients with or without a stoma). The module has been developed according to the guidelines, and approved after formal review. A validation study in the Netherlands has been completed (Sprangers et al., 1999). The module is currently being tested in a range of international phase III trials.

- **Gastric cancer module: QLQ-STO22**
  The gastric cancer module is meant for use among a wide range of patients with adenocarcinoma of the stomach. The module includes 22 items concerning disease and treatment-related symptoms and side effects, dysphagia, nutritional aspects and items about the emotional problems of gastric cancer. The module has been developed according to the guidelines, and approved after formal review. Pre-testing of the provisional module was performed on patients from the UK, France, Germany and Spain. An international field study is being launched.
• **Multiple myeloma module: QLQ-MY24**

The myeloma module is designed for patients with multiple myeloma to assess the symptoms and side effects of treatment and their impact on everyday life (Stead et al., 1999). The module comprises 24 questions addressing four domains of QoL important in myeloma: a pain scale, treatment side effects, social support and future perspective. The module was developed according to the guidelines, and approved after formal review. Pre-testing was carried out in the UK, Norway, Sweden, Denmark and Germany. The field-testing of the module is currently being organised.

• **Ophthalmic cancer module: QLQ-OPT37**

The ophthalmic module is a 37-item questionnaire for use among patients with uveal melanoma. It includes subscales assessing vision impairment (9 items), functional problems due to vision impairment (8 items), eye symptoms (7 items), worry about recurrent disease (6 items), problems with appearance (3 items), problems driving (2 items), headache (1 item), problems reading (1 item). The pre-testing of the module will be conducted in UK, Finland and Sweden.

• **Pancreatic cancer module: QLQ-PAN26**

The pancreatic cancer module is designed for patients at all disease stages undergoing surgical resection, palliative surgical intervention, endoscopic palliation or palliative chemotherapy (Fitzsimmons et al., 1999a,b). The module comprises 26 questions assessing pain, dietary changes, jaundice, altered bowel habit, emotional problems related to pancreatic cancer, and other symptoms (cachexia, indigestion, flatulence, dry mouth, taste changes). Pre-testing of the provisional module was conducted in the UK, Sweden, Spain, Germany, Switzerland, France, Greece, Italy and Hungary. The module is currently being tested in international clinical trials and an international field study (EORTC protocol 15981) is due to be launched in 2001.

• **Prostate cancer module: QLQ-PR25**

The prostate cancer module is a 25-item questionnaire designed for use among patients with localized and metastatic prostate cancer. It includes subscales assessing urinary symptoms (9 items), bowel symptoms (4 items), treatment-related symptoms (6 items) and sexual functioning (6 items). The module is currently available in English, Dutch and French, and is being translated into 15 European languages. The field-testing of the prostate cancer module is currently being organised.

• **Satisfaction with care module: QLQ-SAT32**

The patient satisfaction module is intended to assess cancer patients’ perception of the quality of care received during a hospital stay. It is composed of 32 items assessing doctors’ and nurses’ technical and interpersonal skills, information provision and availability; other hospital personnel kindness, helpfulness, and information giving, exchange of information between caregivers, waiting time (for performing medical tests/treatment, receiving medical tests results), access, comfort/cleanliness, and general satisfaction. A validation study is planned with patients from oncology hospitals in France, Italy, The Netherlands, Sweden and the UK.
QLQ modules under development - phases I and II

The following modules are at earlier stages of development (Phases I and II). Those interested in obtaining information about their current status should contact the person named under the specific module.

- **Carcinoid module**
  *Contact address:* John Ramage, North Hampshire Hospital, Aldermaston Road, Basingstoke, Hampshire RG24 9NA, U.K. Tel: +44 1256 313 637; Fax: +44 1256 313 634; Email JohnRamage@compuserve.com

Translations
Translations

The translation of the core questionnaire and modules into other languages follows a procedure that has been documented in detail in the EORTC Quality of Life Group manual: *Translation Procedure*, Cull *et al.*, 1998. Any modules not initially developed in English are first translated into English, and then to other languages. All translations involve two native speakers of the target language who are also fluent in the original language; these independently translate the questionnaire. The resultant translation is then “back translated” by two native speakers of the original language, with iterations between the forward and backward translation as necessary. There is then a pilot test of the translated questionnaire. A formal report is submitted to the Quality of Life Group, and this is reviewed by at least two members before approval is given.

The core questionnaire is available in many languages in addition to English, and translations of the QLQ supplementary modules are also available in various languages.
Currently available translations of QLQ-C30

At the time of going to press, the following translations of the EORTC QLQ-C30 exist. The original English version has been tested for use with British, American, Australian and Canadian speakers of English. An up to date list of translations of the QLQ-C30 and its modules may be obtained from the Quality of Life Unit at the EORTC Data Center.

Glossary

Core questionnaire:
   The QLQ-C30 is a "core questionnaire" which incorporates a range of physical, emotional and social health issues relevant to a broad spectrum of cancer patients; the core questionnaire should be used, unmodified, in all QLQ assessments.

Items:
   The individual questions on the QLQ-C30 are called items, and are described as $Q_1$, $Q_2$, $Q_3$, etc., where the suffix corresponds to the question-number on the QLQ questionnaire.

Module:
   The core questionnaire may be supplemented by diagnosis-specific and/or treatment-specific questionnaire modules. Modules should be used unmodified and in conjunction with the core questionnaire.

Raw score:
   The score formed by averaging the items that are included in a particular function or symptom scale.

Scales:
   The QLQ comprises distinct scales, each of which represents a different aspect of QoL.

Scale score:
   The raw score transformed to a standardised 0 - 100 final "scale score".

Coding for Statistical Packages

3a: SAS
3b: SPSS
3c: STATA
Appendix 3a: SAS program for scoring the QLQ-C30 and supplementary modules

Installation
To run the commands, first load your data set into SAS.

Then copy these SAS syntax files to the "sas\core\sasmacro" directory and use the "%include" statement before running the SAS macros, e.g.

```
%include 'c:\sas\core\sasmacro\score.sas';
%include 'c:\sas\core\sasmacro\qlscore.sas';
```

Variable names
The QLQ-C30 variables should be named q1, q2, q3, ... q30 (or up to q33 if using the QLQ-C30+3).

If analysing data for the QLQ-BR23, H&N35 or QLQ-LC13, their variables should be named br1, br2, ...; hn1, hn2, ...; or lc1, lc2, ... respectively.

How to use
A display screen will appear in SAS asking you to provide the name of your data set.

Type in the name of your data set without specifying its location, e.g. mydata.

A second screen will ask you to type in the version of the QLQ-C30 that you used.

A third display screen allows you to specify if you would like to score an additional validated EORTC module. Finally, in a 4th screen you can specify the name of the data set containing the data for the BR23, H&N35 and LC13 modules.

What you get
Function scales, symptom scales and single-item scales are calculated and labelled in accordance with the descriptions in the QLQ-C30 Scoring Manual. For example, the emotional functioning scale is calculated from items q21, q22, q23, q24. It is called EF, and is labelled "Emotional functioning". It is scaled to range from 0 to 100, with a high score indicating high emotional functioning.

Note that if you have an existing variable in your data set called EF, it will be automatically overwritten. If this is not what you want, you should copy the original data set and store it under a different name for this application: your revised data set will automatically be copied into your original SAS data set(s).

Out-of-range values
This program checks for items with out-of-range values and treats them as missing.

Missing items
The default action of these programs is to impute missing items provided at least half the scale items are present; the method is described in the Scoring Manual.

Writing your own modules
If you wish to adapt this file for handling items and scales in new QoL items and scales that you develop, it is very easy. Modules %add1, %add2, %add3, were developed for the LC13, BR23 and H&N35, respectively. Thus, all you need to do is prepare a similar macro for your items and scales. This macro can then be run separately, e.g. %add4 (data=mydata)

**General comments**

The code defines macros to score symptoms based on the responses to questions about various health-related issues. The macros manipulate data sets to ensure that values outside the expected range are set to missing, and then calculate symptom scales based on averages of weighted responses for selected symptoms.
**Additional variables:**

- `br9` - 'BR ATTRACTIVENESS'
- `br10` - 'BR LESS FEMININE'
- `br11` - 'BR NAKEDNESS'
- `br12` - 'BR EYES'
- `br13` - 'BR LOST HAIR'
- `br14` - 'BR FELT ILL/UNWELL'
- `br15` - 'BR HOT FLUSHES'
- `br16` - 'BR HEADACHES'
- `br17` - 'BR PAINFUL AREA'
- `br18` - 'BR OVERSENSITIVE AREA'
- `br19` - 'BR PAIN IN ARM'
- `br20` - 'BR MOVEMENTS'
- `br21` - 'BR UPSET/HAIR LOSS'
- `br22` - 'BR FUTURE PERSPECTIVE'

**Symptom scales:**

- `hnpa` - 'HN PAIN'
- `hns` - 'HN SWALLOWING'
- `hnse` - 'HN SENSES'
- `hnspp` - 'HN SPEECH'
- `hnsom` - 'HN SOCIAL EATING'
- `hnsc` - 'HN SOCIAL CONTACT'
- `hnsex` - 'HN SEXUALITY'
- `hnhte` - 'HN TEETH'
- `hnnom` - 'HN OPENING MOUTH'
- `hnhr` - 'HN DRY MOUTH'
- `hnss` - 'HN STICKY SALIVA'
- `hnco` - 'HN COUGHED'
- `hnfe` - 'HN FEEDING TUBE'
- `hnwl` - 'HN WEIGHT LOSS'
- `hngw` - 'HN WEIGHT GAIN'

**Additional variables:**

- `hn1` - 'HN PAIN IN MOUTH'
- `hn2` - 'HN PAIN IN JAW'
- `hn3` - 'HN SORE MOUTH'
- `hn4` - 'HN PAINFUL THROAT'
- `hn5` - 'HN SWALLOW LIQUIDS'

```

---

**Additional variables:**

- `br9` - 'BR ATTRACTIVENESS'
- `br10` - 'BR LESS FEMININE'
- `br11` - 'BR NAKEDNESS'
- `br12` - 'BR EYES'
- `br13` - 'BR LOST HAIR'
- `br14` - 'BR FELT ILL/UNWELL'
- `br15` - 'BR HOT FLUSHES'
- `br16` - 'BR HEADACHES'
- `br17` - 'BR PAINFUL AREA'
- `br18` - 'BR OVERSENSITIVE AREA'
- `br19` - 'BR MOVEMENTS'
- `br20` - 'BR UPSET/HAIR LOSS'
- `br21` - 'BR PAINFUL AREA'
- `br22` - 'BR FUTURE PERSPECTIVE'

**Symptom scales:**

- `hnpa` - 'HN PAIN'
- `hns` - 'HN SWALLOWING'
- `hnse` - 'HN SENSES'
- `hnspp` - 'HN SPEECH'
- `hnsom` - 'HN SOCIAL EATING'
- `hnsc` - 'HN SOCIAL CONTACT'
- `hnsex` - 'HN SEXUALITY'
- `hnhte` - 'HN TEETH'
- `hnnom` - 'HN OPENING MOUTH'
- `hnhr` - 'HN DRY MOUTH'
- `hnss` - 'HN STICKY SALIVA'
- `hnco` - 'HN COUGHED'
- `hnfe` - 'HN FEEDING TUBE'
- `hnwl` - 'HN WEIGHT LOSS'
- `hngw` - 'HN WEIGHT GAIN'

**Additional variables:**

- `hn1` - 'HN PAIN IN MOUTH'
- `hn2` - 'HN PAIN IN JAW'
- `hn3` - 'HN SORE MOUTH'
- `hn4` - 'HN PAINFUL THROAT'
- `hn5` - 'HN SWALLOW LIQUIDS'
- `hn6` - 'HN SWALLOW PURIFIED FOOD'
- `hn7` - 'HN SWALLOW SOLID FOOD'
- `hn8` - 'HN SWALLOW AND CHOKING'
- `hn9` - 'HN SENSE OF TASTE'
- `hnd` - 'HN SENSE OF SMELL'
- `hno` - 'HN HOUSEHOLD'
- `hnf` - 'HN HOBBIES'
- `hnk` - 'HN PAIN KILLERS'
- `hnpu` - 'HN NUTRITIONAL SUPPORT'
- `hnfe` - 'HN FEEDING TUBE'
- `hnwl` - 'HN WEIGHT LOSS'
- `hngw` - 'HN WEIGHT GAIN'

Appendix 3b: SPSS program for scoring the QLQ-C30 and supplementary modules

Installation
The easiest way to use this SPSS syntax file is to copy it into the same directory as your SPSS data set (for example, the same directory as your SPSS .SAV file).

How to use
The QLQ-C30 variables should be named q1, q2, q3, ... q30 (or up to q33 if using the QLQ-C30(+3)). If analysing data for the QLQ-BR23, QLQ-H&N35 or QLQ-LC13, their variables should be named br1, br2, ...; hn1, hn2, ...; or lc1, lc2, ... respectively.

To run the commands, first load your data set into SPSS. Either use the Windows interface to do this, or type for example:

```
GET FILE <your .SAV data set>.
```

Then load this SPSS syntax file into the syntax editor window. At the end of this file, type one of the following commands as appropriate, according to the version of the QLQ-C30 that you used (V3, V2, V1, or (+3) respectively):

```
qlqscal 3.
qlqscal 2.
qlqscal 1.
qlqscal 303.
```

For the BR23, H&N35 and LC13 modules the corresponding commands are:

```
brscal.
hnscal.
lcsal.
```

Finally, terminate with EXECUTE and run the commands.

```
EXECUTE.
```

An alternative method is to load the QLQ.sps syntax file into the syntax editor, run all the commands, and then in a new syntax editor window type and run, for example,

```
GET FILE TEST.SAV.  (this example assumes your data set is called TEST.SAV)
qlqscal 1.
EXECUTE.
```

What you get
Function scales, symptom scales and single-item scales are calculated and labelled in accordance with the descriptions in the QLQ-C30 Scoring Manual. For example, the emotional functioning scale is calculated from items q21, q22, q23, q24. It is called EF, and is labelled "Emotional functioning". It is scaled to range from 0 to 100, with a high score indicating high emotional functioning.

Note that if you have an existing variable in your data set called EF, it will be automatically overwritten. If this is not what you want, you should take care not to save your revised data set into your original file on disk when you quit from SPSS.

Out-of-range values
This program sets out-of-range values to SPSS "user-missing". If you have used special codes to indicate not applicable or other values, you can cancel the user-missing codes by entering
MISSING VALUES q1 TO q30 ()
(and similarly for the QLQ supplementary modules).

Missing items
The default action of these programs is to impute missing items provided at least half the scale items are present; the method is described in the Scoring Manual. This imputation algorithm accounts for part of the complexity of the code in qlqsub.

You can over-ride this default action. To cause the presence of any missing values in the scale items to result in their scale score being missing, enter XMISS after the command. For example,

```plaintext
qlqscal 1 XMISS.
```

Writing your own modules
If you wish to adapt this file for handling items and scales in new QoL items or scales that you develop, it is very easy.
The files programs brscal, hncal and lcsal all correspond directly to the tables given in the QLQ-C30 Scoring Manual, and serve as examples. Thus, all you need to do is prepare a similar table for your own items or scales, and copy the contents of the table into your own file. This can then be edited to use the identical syntax to the examples.
Make sure that the header and final "!enddefine ." lines also follow the example, with the name on the "define" command being the name that you call to run the program.

That’s all – it’s simple!
define qlqsub ( !POSITIONAL !TOKENS(1) /!POSITIONAL !TOKENS(1) /!POSITIONAL !TOKENS(1) /!POSITIONAL !TOKENS(1) /!POSITIONAL !TOKENS(1) /!SCALE . IF (!XMISS EQ 1  AND  #SNUMR LT !NITEMS) !SCALE = $SYSMIS . VARIABLE LABEL !SCALE !SCALNAM .

Appendix 3c: STATA ado files for scoring the QLQ-C30 and supplementary modules

Installation
The .ADO files for STATA should be copied to your ADO directory; usually this will be a directory such as C:\ADO. To check for existing ADO directories, enter STATA and type

    . adopath

Details are given in the STATA manuals (e.g. Section U23.5, U23.6 in the Release 5 User's guide)

How to use
The QLQ-C30 variables should be named q1, q2, q3, ... q30 (or up to q33 if using the QLQ-C30 (+3)). If analysing data for the QLQ-BR23, QLQ-H&N35 or QLQ-LC13, their variables should be named br1, br2, ...; hn1, hn2, ...; or lc1, lc2, ... respectively.

To run the commands, first load your data set into STATA. Typically, type

    . use <your data set>

Then enter one of the following commands as appropriate, according to the version of the QLQ-C30 that you used (V3, V2, V1, or (+3) respectively):

    . qlqscal 3
    . qlqscal 2
    . qlqscal 1
    . qlqscal 303

For the BR23, H&N35 and LC13 modules the corresponding commands are:

    . brscal
    . hnscal
    . lcscal

What you get
Function scales, symptom scales and single-item scales are calculated and labelled in accordance with the descriptions in the QLQ-C30 Scoring Manual. For example, the emotional functioning scale is calculated from items q21, q22, q23, q24. It is called EF, and is labelled "Emotional functioning". It is scaled to range from 0 to 100, with a high score indicating high emotional functioning.

Note that if you have an existing variable in your data set called EF, it will be automatically over-written. If this is not what you want, you should take care not to save your revised data set into your original file on disk when you quit from STATA.

Out-of-range values
The ado files automatically check for items with out-of-range values, and will set these to missing. Any changes are notified on the screen. These changes affect the working data set, and it is up to you to decide whether to save this revised data set to disk, possibly overwriting your original disk file. When you quit from STATA, it will ask you whether you wish to save (overwrite) your disk file.

Missing items
The default action of these programs is to impute missing items provided at least half the scale items are present; the method is described in the Scoring Manual. This imputation algorithm accounts for part of the complexity of the code in qlqsub.ado.

You can over-ride this default action. To cause the presence of any missing values in the scale items to result in their scale score being missing, enter XMISS after the command. For example,
. qlqscal 1 XMISS

Writing your own modules
If you wish to adapt these ado files for handling items and scales in new QoL items or scales that you develop, it is very easy.

The files brscal.ado, hncal.ado and lcsal.ado all correspond directly to the tables given in the QLQ-C30 Scoring Manual, and serve as examples. Thus, all you need to do is prepare a similar table for your own items or scales, and copy the contents of the table into your own file called myitems.ado. This can then be edited to use the identical syntax to the examples. Make sure that the header and final "end;" lines also follow the example, with the name on the "program define" command being identical to the name of your ado file.

That's all – it's simple!
